

Test Results as of 10/19/07

New In This Update

- Additional birds and mosquito pools have tested positive for the presence of West Nile virus (WNV).

Human Testing

- To date, one human case of WNV has been identified from Middlesex County. Human testing for WNV is being conducted at the New Jersey Department of Health and Senior Services' Public Health and Environmental Laboratory in Trenton and at public health labs in other states.

Avian Testing

- Three new positive birds were reported this week.
- To date, 171 birds have been received for testing at the Department of Health and Senior Services Public Health and Environmental Laboratory. Of those tested, 44 birds found in Atlantic (3), Essex (3), Mercer (3), Middlesex (1), Monmouth (6), Morris (6), Ocean (15), Sussex (2) and Union (5) counties have been confirmed positive for the presence of WNV.

Mosquito Testing

- To date, 6,362 mosquito pools have been tested for the presence of WNV. Three hundred twenty-eight (328) positive pools have been found as follows: Atlantic (8), Bergen (105), Camden (16), Cumberland (3), Essex (4), Gloucester (2), Hudson (70), Hunterdon (9), Mercer (36), Middlesex (23), Monmouth (8), Morris (5), Ocean (10), Passaic (11), Somerset (4), Sussex (1), Union (12), and Warren (1).

Horse Testing

- To date, one horse from Ocean County has tested positive for the presence of WNV. Equine testing is conducted by the New Jersey Department of Agriculture's animal health laboratory in Trenton and positive results are sent to the National Veterinary Services Lab (NVSL) in Ames, Iowa for confirmation. For more information, visit the Department of Agriculture web site at www.state.nj.us/agriculture.

Additional Information & Advisories

- Given the unseasonably warm weather this fall, the risk of WNV infection remains and people should continue to take steps to eliminate mosquito-breeding areas around their homes and protect themselves and their families from infection.
- Among the personal precautions residents can take now are such measures as eliminating standing

water on their own property (such as clearing clogged gutters, draining flower pots, recycling old car tires, etc.), and repairing window and door screens. In the spring, summer, and fall residents can spray insect repellent on their clothing and exposed skin in accordance with labeling directions, wear long sleeved shirts and pants when outdoors, or curb outdoor activities at dawn, dusk and during the evening.

- The West Nile virus, an arboviral disease, is transmitted through the bite of a mosquito that has picked up the virus by feeding on an infected bird. WNV is not directly transmitted from birds to humans. WNV infection generally causes no symptoms or just mild, flu-like symptoms; however, the elderly are at higher risk of more severe disease.
- In New Jersey, a total of 89 people have been diagnosed with WNV between 1999 and 2006. Lab testing confirmed WNV infection in these residents, with five resulting fatalities. WNV activity (identified from avian, equine and/or mosquito surveillance) has been detected in every county in New Jersey.
- New Jersey's WNV surveillance, control and prevention activities involve the coordinated efforts of a number of federal, state and local agencies. These include the New Jersey Departments of Health and Senior Services, Environmental Protection, and Agriculture, the CDC, the State Mosquito Control Commission, the Rutgers Center for Vector Biology, and local health and mosquito control agencies.
